KSU-Buy/Sell (Yearling-Fed)

An Excel spreadsheet for calculating breakeven cattle prices of yearlings placed on feed

AgManager.info

Version- 10.13.2015

INTRODUCTION

A spreadsheet program to calculate the maximum price that can be paid for feeder cattle given an expected fed cattle selling price and cost of gain. Additionally, this program also calculates the breakeven fed cattle selling price needed given a yearling purchase price and an estimated cost of gain.

INSTRUCTIONS FOR THE USER:

Be sure to **"Enable Content"** and **"Enable Macros"** for the spreadsheet to function correctly.
In the ***Sell*** and ***Buy*** sheets all blue numbers are inputs and all black numbers are calculated from these inputs. The spreadsheet automatically recalculates every time an additional input is entered. Thus, it is important to wait until all data have been entered and reviewed before interpreting any of the calculated results (i.e., black numbers).

Breakeven Selling Price Worksheet

(Blue values in shaded cells are inputs to be entered)

Purchase weight (lbs)	525
Purchase price ($/cwt)	$205.00
Purchase date (mm/dd/yy)	09/12/26
Average Daily Gain (pay-to-pay)	2.15
Feeding cost of gain ($/cwt)	$85.00
Interest rate on feeder and feeding cost of gain	7.00%
Percent death loss*	1.80%
Costs per head (trucking, vaccines, backrounding, e	$20.00
Desired profit per head	$0.00

Increments to use in tables below

Selling Weight (lbs)	25.0
Purchase Price ($/cwt)	$5.00
Feeding Cost of Gain ($/cwt)	$5.00

* Enter ONLY if death loss is NOT included in feeding cost of gain, otherwise enter zero.

** Do not enter any costs included in feeding cost of gain.
