Language Processing and Knowledge in the Web has been an area of great and steadily increasing interest within the language processing and related communities over the past years. Both in terms of academic research and commercial applications, the Web has stimulated and influenced research directions, yielding significant results with impact beyond the Web itself. Thus, the conference turned out to be a very useful forum to highlight the most recent advances within this domain and to consolidate the individual research outcomes.

About one third of the papers are dedicated to fundamental computational linguistics research in multilingual settings. On the one hand, the work deals with different languages, such as German, Manipuri[1], or Chinese[2]. On the other hand, it deals with a wide range of computational linguistics tasks, such as word segmentation[3], modeling compounds[4], coreference resolution[5], word sense annotation[6], named entity recognition[7], or lexical-semantic processing[8].
