

summary

Impossible!

But the slides are on the web

What happened here?

Terrific cultural enrichment

We made new connections

Other ways to look at our favorite physics

New people to talk to

What's next?

Identify common problems to pursue further

I'll show a strawman set of problems

Don't throw rocks!

throw emails to Barbara.Jacak@stonybrook.edu

**Pursue possibility of a workshop at theory venue
e.g. ITP Santa Barbara**

**Arrange cross-disciplinary talks/session at APS
meetings (DPP, DNP, DAMOP)**

Common problems

Thermalization

How fast can the systems thermalize?

do they actually thermalize?

HOW do they thermalize?

collisions (of what) vs. interaction with (collective) fields

Models & their validity range

Kinetic models for collective processes

Hydrodynamics

Correlations among particles in strongly coupled plasma

Affect density structure of plasma

Should give rise to correlations also in the final state

Quasi-bound states, EOS

Common problems, ctd.

What happens when systems get dilute?

Recombination and final state interactions

Diagnostics

Systems are short-lived!

**study space-time evolution through time integrated
observables (radiation or probes)**

must figure out how to use correlations to extract

Use of final state cluster distributions for initial state info

Diagnostics of collective motions

multiparticle emission variables

single particles in multiparticle field, acoustic waves
