

POSITION CONTROL

ADDITIONAL NOTES

- A backup method (e.g. flex shaft) of manually retracting the Pixel detectors will be added
- The method of attaching to the pixel support structure will likely change to one where the drive system is built up after the attachment is made
- Limit switches will prevent the axes drives from exceeding the “kinematic range” of the mounts
- The next level of prototype will involve multiple axes and position feedback
- Extensive life testing of the drive system prototype is planned
- Functional test of kinematic mounts with CF half-cylinder structure
- Evaluate effect of magnetic materials
