

Depending on the speed of your hardware, the recalculation process may from 30 seconds to over a minute, during which time Calc will become too slow to use. In order to be able to operate the test, please do not forget to switch Macro Recording on. The document must not be read-only, use “Edit File” toolbar button in case of read-only document.

Problem Description

This document contains three data sheets containing sets of daily groundwater different sites: one located in Charleston, South Carolina, one located in Hilton one located in Orlando, Florida. All data used in this document are publicly ava from the groundwater data archive website of the US Geological Survey.

Designation	Date	Level	Elevation	Average	Delta Low
D27	1990-04-03	5.29	2.21	-55.22	-98.3
D27	1990-04-04	5.33	2.17	-55.18	-98.3

D27	1990-04-15	6.08	1.42	-54.43	-98.9
D27	1990-04-16	6.14	1.36	-54.37	-98.9

On each data sheet, column A:K contain raw data, of which the only data used is column K. Column K contains daily depths to the water table below ground surface as measured. These depths are converted into elevations by subtracting them from the known ground surface elevation in cell L2. Column M shows the difference from the average elevation over the entire period. Column N and O show the differences from the lowest and highest elevations over the entire period, respectively.

When pressing the "Re-calculate" button, it forces all the formula cells present in the spreadsheet to be recalculated, that is, columns L through O in the two data sheets will go through a full recalculation. Once the recalculation is finished, the Status cell will show Finished and the Duration cell will show the number of seconds for the whole re-calculation has taken to complete.

Proposed Solution

We will make two changes to Calc core in order to speed up the recalculation. First, we will change Calc's cell storage to store their raw values in arrays, and modify the formula in a cell so that the entire array can be fetched in one step rather than on a per-cell basis. Secondly, we will modify the formula engine to identify the range of identical formula tokens and use that information during recalculation to only calculate those cells in that range in one step using GPU. We will only track identical formulas for the same column.
